

Make It Do Something — Contact Form

Name: Sibgha Mursaleen

Date: 23/08/2026

My Dynamic Feature

I chose a **working contact form** as the one dynamic feature of my portfolio.

I chose it because visitors need a simple way to contact me directly from my portfolio instead of only viewing static information.

What is a Backend?

A backend is the part of a website that works behind the scenes. The user normally interacts with the frontend, while the backend or a backend service handles data, processing, and communication.

What Does My Contact Form Do?

When a visitor fills in my contact form, they provide their name, email address, and message. When they submit the form, the information is sent to the form-handling service instead of just staying on the webpage.

The service processes the submission and sends the submitted information to my email inbox.

How Does the Data Flow?

The basic flow is:

Visitor → Portfolio Contact Form → FormSubmit → My Email Inbox

The visitor enters their information on the portfolio and presses the submit button. The form sends that information to FormSubmit, which handles the submission and forwards the details to my email.

I tested the feature myself using a real submission. The submitted information successfully arrived in my inbox, confirming that the feature works on the live portfolio.

Evidence

I submitted a test message through my live portfolio. The resulting email from FormSubmit contained the submitted form information, confirming that the message successfully reached me.

Evidence: Screenshot of the received FormSubmit email.
